

All in a days work

On Earth Day, April 22, 2007, **six un-trained volunteers** from the Saint James Episcopal Church in La Jolla California and Habitat for Humanity set up the house above **in 3 hours** for display at EarthFair in Balboa Park, San Diego.

- ? 7 to 7:30 am - Unloaded a Profile Lumber 400 sq.ft. House Kit
- ? 7:30 to 9:30 - Assembled the House Frame using only battery-powered drills.
- ? 10:00 to 5:00 - Manned the display for the San Diego Earth Fair
- ? 5:00 to 6:00 Disassembled the structure and re-loaded the pick-up truck

Simply Save the World Lumber

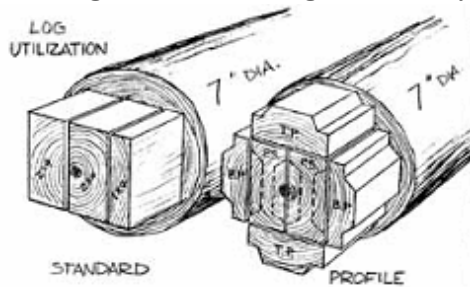

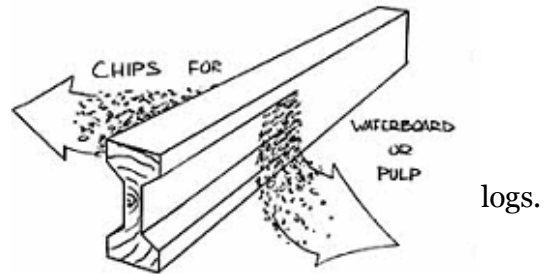

Is it really that simple? Can lumber help save the world?
 YES! And here's how:

- ? **Owning a home provides the security we all need to start living in peace.**
- ? **Housing is the cornerstone of the whole economy, fueling consumption and generating jobs, allowing people to live in peace because they have what they need.**
- ? **Profile Lumber shapes makes it possible to build a low cost expandable home for yourself**

It's so simple; Profile Lumber maximizes the amount of fiber and lumber from trees by changing how it's milled.

By cutting **I** shapes instead of the standard rectangle the process generates wood chips for making paper, ethanol, particle board and other uses.

It gets better: Milling **C** shapes that interlock with the **I** shapes almost doubles the amount of lumber from some **And then better still!** The interlocking lumber makes strong, cost effective buildings. (See our full size demo buildings at the San Diego Earth Day)

Profile Lumber makes wood an even more sustainable home building material. It reduces the number of trees that have to be cut and maximizes the use of every life-sustaining, carbon-sequestering, oxygen-producing tree.

Low cost Profile Lumber homes could lead to smaller families, more disposable income, more time to get a better education, pay off loans faster, enjoy better health, and have more leisure time away from the office, and maybe time to grow your own food.
